MISCELLANEOUS: A 36 amino-acid island is present in the 18th
leucine-rich repeat. An island domain has also been found among
the extra-cellular LRRs of the brassinosteroid receptor BRII and
has been shown to be critical for its function.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SEQUENCE FROM N.A., FUNCTION, TISSUE SPECIFICITY, AND GLYCOSYLATION. Phytosulfokine receptor precursor (EC 2.7.1.37) (Phytosulfokine LRR receptor kinase).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  FUNCTION: Receptor with a serine/threonine-protein kinase activity. Receptor with a serine/threonine-protein kinase activity. Regulates, in response to phytosulfokine binding, a signaling cascade involved in plant cell differentiation, organogenesis and sometic embryogenesis.

CATALYTIC ACTIVITY: ATP + a protein = ADP + a phosphoprotein. SUBCELLULAR LOCATION: Type I membrane protein; plasma membrane

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sequence 893. Application US/10101464A

Patent No. 6768041

GENERAL INPORMATION:

APPLICANT: Strabala, Timothy

APPLICANT: Strabala, Timothy

APPLICANT: Niewwenhuizen, Nicolaas

APPLICANT: Miewwenhuizen, Nicolaas

APPLICANT: Miewwenhuizen, Sollated from Plant Cells

TITLE OF INVENTION: Compositions Isolated from Plant Cells

TITLE OF INVENTION: and Their Use in the Modification of Plant Cell Signaling

FILE REFERENCE: 11000.1020c2

CURRENT FILING DATE: 2002-03-18

PRIOR PILING DATE: 2000-10-01

PRIOR FILING DATE: 1999-01-12

PRIOR FILING DATE: 1999-01-01

SOFTWARE: FABLECATION NUMBER: PCT/US00/00724

NUMBER OF SEQ ID NOS: 989

SOFTWARE: PASESEQ for Windows Version 4.0

TENDENT PARTING DATE: 100-01-11

NUMBER OF SEQ ID NOS: 989
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       13;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ð
                                   The present sequence is that of AFP2, an antifreeze protein of perennial ryegrass. The encoding cDNA was isolated from a leaf blade cDNA expression library. The invention provides forage grass (perennial ryegrass and tall fescue) antifreeze proteins and the polymuclocitides can canding them ADM41458-ADN41483. The polymuclecitides were isolated from tissues taken at different times of year (winter and spring) and from different parts of the plants. The polymuclecitides can be used to modulate the cold tolerance of an organism, especially plants, mammals, insects, fungi, archaea and bacteria. The method involves incorporating an antifreeze polymuclecitide, under the control of a gene promoter sequence, into the genome of the organism, or introducing double-stranded CR NA corresponding to the polymuclecitide into the cells of the organism, antifreeze protein can be used for the cryopreservation of a cell or tissue, as a food additive of a frozen food product, in a method for decreasing the time required to dehydrate a composition, to treat a disorder characterised by bloorystals associated with disorders such as gout and kidney stones, to preserve the viability of a molecular biology reagent, to destroy unwanted tissue in a patient e.g. tumour tissue, and control and protect a plant from damage due to frost or freezing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                240

The present sequence is that of an antifreeze protein of tall fescue. The encoding cDNA was isolated from a leaf blade cDNA expression library. The invention provides forage grass (perennial ryegass and tall fescue)

cutifreeze proteins and the polymucleotides encoding them ADMA1458-

ADM41483. The polymucleotides were isolated from tissues taken at the polymucleotides were isolated from different parts of the plants. The polymucleotides can be used to modulate the cold to the plants. The method involves incorporating an antifreeze polymucleotide, under the control of a gene promoter sequence, into the genome of the organism, or introducing double-stranded RNA corresponding to the polymucleotide into the cells of the organism, thereby inhibiting to the polymucleotide into the cells of the organism, thereby inhibiting to the polymucleotide into the cells of the organism, thereby inhibiting to the polymucleotide into the cells of the organism, thereby inhibiting to the polymucleotide into the cells of the organism, thereby inhibiting to the polymucleotide into the cells of the organism, thereby inhibiting to a frozen food product, in a method for decreasing the time required to dehydrate a composition, to treat a disorder characterised by blocrystals associated with disorders such as gout and kindey stones, to preserve the viability of a molecular biology reagent, to destroy unwanted tissue in a patient of the control of the control of the control of a protect a plant from damage due to

The encoding cDNA was isolated from a leaf blade cDNA expression library. The invention provides forage grass (perennial ryegrass and tall fescue) antifreeze proteins and the polymucleotides encoding them ADM41458-C different times of year (winter and spring) and from different parts of the plants. The polymucleotides can be used to modulate the cold tolerance of an organism, especially plants, mammals, insects, fungi, archaea and bacteria. The method involves incorporating an antifreeze polymucleotide, under the control of a gene promoter sequence, into the genome of the organism, or introducing double-stranded RNA corresponding to the polymucleotide into the cells of the organism, thereby inhibiting to the polymucleotide into the cells of the antifreeze protein can be used for the cryopreservation of a cell or tissue, as a food additive of a frozen food product, in a method for decreasing the time required to dehydrate a composition, to treat a disorder characterised by biocrystals associated with disorders such as gout and kidney stones, to preserve the vieblity of a molecular biology reagent, to debycout under the coll and the coll of the organism.

The present sequence is that of AFP5, an antifreeze protein of perennial ryegrass. The encoding cDNA was isolated from a leaf blade cDNA expression library. The invention provides forage grass (perennial ryegrass and tall feecue) antifreeze proteins and the polynucleotides conciding them ADM41458-ADM41483. The polynucleotides were isolated from tissues taken at different times of year (winter and spring) and from different parts of the plants. The polynucleotides were isolated from tissues taken tarts of the plants. The plants, especially plants, mammals, insects, fungi, archaea and bacteria. The method involves incorporating an antifreeze polynucleotide, under the control of a gene promoter. Sequence, into the genome of the organism, or introducing double-stranded CRNA corresponding to the polynucleotide into the cells of the organism, thereby inhibiting expression of an antifreeze protein can be used for the cryopresservation of a cell or tissue, as a food additive of a frozen food product, in a method for decreasing the time required to dehydrate a composition, to treat a continual kindney stones, to preserve the viability of a molecular biology reagent, to destroy unwanted tissue in a patient e.g. tumour tissue, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 a;

The present sequence is that of an antifreeze protein of perennial ryegrass. The encoding cDNA was isolated from a leaf and pseudostem cDNA expression library. The invention provides forage grass (perennial ryegrass and tall fescue) antifreeze proteins and the polymucleotides encoding them ADM41458-ADM41483. The polymucleotides were isolated from tissues taken at different times of year (whiter and spring) and from different parts of the plants. The polymucleotides can be used to modulate the cold tolerance of an organism, especially plants, mammals, insects, fungi, archaea and bacteria. The method involves incorporating an antifreeze polymucleotide, under the control of a gene promoter sequence, into the genome of the organism, or introducing double-stranded and are expected to the organism, or into the genome of the organism, or into the expansion of the organism, when the control or a gene promoter sequence, into the define of the organism, when the control or a sequence or the control or a sequence or the control or a sequence or the control or a sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       GINNIHVSGSINITVVTGSDNTVVGSINHVVSGTKHIVTDNNNVVSGNDNNVSGSFHTVSGEH 240

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              thereby inhibiting expression of an antifreeze polypeptide. The antifreeze protein can be used for the cryopreservation of a cell or tissue, as a food additive of a frozen food product, in a method for decreasing the time required to dehydrate a composition, to treat disorder characterised by biocrystals associated with disorders such as gout and kidney stones, to preserve the viability of a molecular biology reagent, to destroy unwanted tissue in a patient e.g. tumour tissue, and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               tolerance of an organism, especially plants, mammals, insects, fungi, archeaa and bacteria. The method involves incorporating an antifreeze polynucleotide, under the control of agene promoter sequence, into the genome of the organism, or introducing double-stranded RNA corresponding to the polynucleotide into the cells of the organism, thereby inhibiting expression of an antifreeze polypetide. The antifreeze protein can be used for the cryopreservation of a cell or tissue, as a food additive of a frozen food product, in a method for decreasing the time required to dehydrate a composition, to treat a disorder characterised by biocrystals associated with disorders such as gout and kidney stones, to preserve the viability of a molecular biology reagent, to destroy unwanted tissue in a
                                                                                                                                                                                                                                                                                                                                                                             /note= "7-amino acid sequence repeat region identified in

N-PSDB; ADM41463,

Interest proteins and the polynucleotides encoding them ADM41458antifreeze proteins and the polynucleotides encoding them ADM41458ADM41483. The polynucleotides were isolated from tissues taken at
different times of year (winter and spring) and from different parts of
the plants. The polynucleotides can be used to modulate the cold
to clerance of an organism, especially plants, mammals, insects, fungi,
carchaea and bacteria. The method involves incorporating an antifreeze
polynucleotide, under the control of a gene promoter sequence, into the
copynucleotide into the cells of the organism, thereby inhibiting
to the polynucleotide into the cells of the organism, thereby inhibiting
expression of an antifreeze polypeptide. The antifreeze protein can be
cused for the cryopreservation of a cell or tissue, as a food additive of
a frozen food product, in a method for decreasing the time required to
calcabydrate a composition, to treat a disorder characterised by biocrysteals
cassociated with disorders such as gout and kidney stones, to preserve the
viability of a molecular biology reagent, to destroy unwanted tissue in a
copy front or freeing New antifreeze proteins and encoding polymucleotides, useful for modulating cold tolerance in organisms, as food additives, or for treating tumors or disorders associated with the presence of unwanted present sequence is that of an antifreeze protein of Claim 7; SEQ ID NO 19; 71pp; English biocrystals (e.g. gout) rost or freezing Sequence 277 AA; 178 169 229 ADM41483; RESULT 8 셤 à g 원 ò ò 셤 à d
